MySQL 5.5 Reference Manual :: 13 Storage Engines :: 13.6 The InnoDB Storage Engine :: 13.6.2 InnoDB Configuration

13.6.2. InnoDB Configuration

[+/-]

[13.6.2.1. Using Per-Table Tablespaces](#)

[13.6.2.2. Using Raw Devices for the Shared Tablespace](#)

[13.6.2.3. Creating the InnoDB Tablespace](#)

[13.6.2.4. Dealing with InnoDB Initialization Problems](#)

If you do not want to use **InnoDB** tables, start the server with the `--skip-innodb` option to disable the **InnoDB** startup engine.

Caution

InnoDB is a transaction-safe (ACID compliant) storage engine for MySQL that has commit, rollback, and crash-recovery capabilities to protect user data. **However, it cannot do so** if the underlying operating system or hardware does not work as advertised. Many operating systems or disk subsystems may delay or reorder write operations to improve performance. On some operating systems, the very `fsync()` system call that should wait until all unwritten data for a file has been flushed might actually return before the data has been flushed to stable storage. Because of this, an operating system crash or a power outage may destroy recently committed data, or in the worst case, even corrupt the database because of write operations having been reordered. If data integrity is important to you, you should perform some “pull-the-plug” tests before using anything in

Insert this.

Okay, got it.

Phew, my data's safe.

Write this to disk

All over it!

I know better than
he does, I'll just
let this sit in a
buffer for a while.

I have no idea what
you're talking about.

trust no one!

...trust a bunch of ones. Mostly.
